**Jan 2024**

This study examines the determinants of entrepreneurial attitude and intention among Emirati youth, with the aim of identifying critical predictors to promote entrepreneurship in the region. Using a cross-sectional survey of 324 Emirati university students and structural equation modelling, we find that self-belief positively impacts intention and mitigates risk aversion, while risk aversion negatively affects entrepreneurial intention. A positive attitude towards entrepreneurship predicts intention, and the subjective norm influences entrepreneurial attitude, though the effect of entrepreneurial education on intention is inconclusive. Our results underscore the need for national policies that provide access to capital, such as grants, subsidies, and low-interest loans, and the integration of entrepreneurship education at all levels of education in the UAE.

**Purpose and Importance of the Study for the UAE:** The study aims to elucidate the factors that influence the entrepreneurial intentions of Emirati university students. It's critical for the UAE's strategic goal of fostering a knowledge-based economy.

**Methodology:** The paper uses a quantitative approach, likely involving surveys or questionnaires to gather data from university students, which is then analyzed statistically.

**Study Key Points:** The study may highlight important factors like social influence, personal attitude, and perceived behavioral control as determinants of entrepreneurial intentions.

**Main Findings:** The findings likely indicate which factors are most significant in shaping the entrepreneurial mindset among the student population in the UAE.

**Recommendations:** Based on the findings, the paper probably proposes recommendations for policy-makers, educators, and other stakeholders to encourage entrepreneurial activities among youths.
